## 7.4 Services

#### **Contents**

- Services for long tasks.
- IntentService

## Services is an advanced topic

- Services are complex.
- Many ways of configuring a service.
- This lesson has introductory information only.
- Explore and learn for yourself if you want to use services.

# **Services for Long Tasks**

#### What is a service?

A <u>Service</u> is an application component that can perform long-running operations in the background and does not provide a user interface.

## What are services good for?

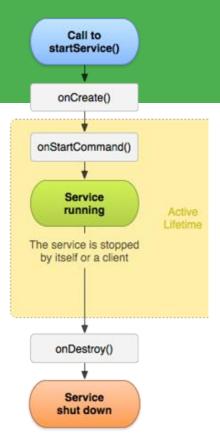

- Network transactions.
- Play music.
- Perform file I/O.
- Interact with a database.

#### Characteristics of services

- Started with an Intent.
- Can stay running when user switches applications.
- Lifecycle—which you must manage.
- Other apps can use the service—manage permissions.
- Runs in the main thread of its hosting process.

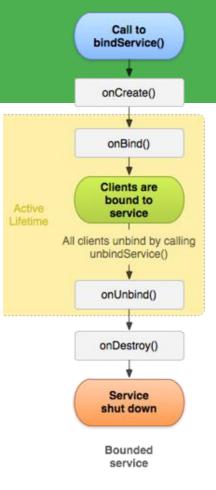

#### Forms of services: started

- Started with startService()
- Runs indefinitely until it stops itself
- Usually does not update the UI

#### Forms of services: bound

- Offers a client-server interface that allows components to interact with the service
- Clients send requests and get results
- Started with bindService()
- Ends when all clients unbind

#### Services and threads

Although services are separate from the UI, they still run on the main thread by default (except IntentService)

Offload CPU-intensive work to a separate thread within the service

## **Updating the app**

If the service can't access the UI, how do you update the app to show the results?

Use a broadcast receiver!

## **Foreground services**

Runs in the background but requires that the user is actively aware it exists—e.g. music player using music service

- Higher priority than background services since user will notice its absence—unlikely to be killed by the system
- Must provide a notification which the user cannot dismiss while the service is running

## **Background services limitations**

- Starting from API 26, background app is not allowed to create a background service.
- A foreground app, can create and run both foreground and background services.
- When an app goes into the background, the system stops the app's background services.
- The startService() method now throws an <u>IllegalStateException</u> if an app is targeting API 26.
- These limitations don't affect foreground services or bound services.

### Creating a service

- <service android:name=".ExampleService" />
- Manage permissions.
- Subclass IntentService or Service class.
- Implement lifecycle methods.
- Start service from Activity.
- Make sure service is stoppable.

## Stopping a service

- A started service must manage its own lifecycle
- If not stopped, will keep running and consuming resources
- The service must stop itself by calling <u>stopSelf()</u>
- Another component can stop it by calling <u>stopService()</u>
- Bound service is destroyed when all clients unbound
- IntentService is destroyed after onHandleIntent() returns

## **IntentService**

#### **IntentService**

- Simple service with simplified lifecycle
- Uses worker threads to fulfill requests
- Stops itself when done

Ideal for one long task on a single background thread

#### **IntentService Limitations**

- Cannot interact with the UI
- Can only run one request at a time
- Cannot be interrupted

#### IntentService restrictions

- <u>IntentService</u> are subjected to the new restrictions on background services.
- For the apps targeting API 26, <u>Android Support Library</u>
   26.0.0 introduces a new <u>JobIntentService</u>.
- JobIntentService provides the same functionality as <u>IntentService</u> but uses jobs instead of services.

## IntentService Implementation

```
public class HelloIntentService extends IntentService {
   public HelloIntentService() { super("HelloIntentService");}
  @Override
protected void onHandleIntent(Intent intent) {
    try {
         // Do some work
     } catch (InterruptedException e) {
         Thread.currentThread().interrupt();
} // When this method returns, IntentService stops the service, as appropriate.
```
